Project Goal

The main idea of this project is to create commercial android applications to solve the issue of late cancellations and rescheduling in private practices. These applications will ease the difficulties of both client and service provider in this seemingly simple but expensive problem with easy to use interfaces for the tech-challenged, text message notifications, and minimal private information exchange.

Motivation Approach

Many projections over the years show that cancellations may cost a single physician as much as $150,000[1] and most only charge a nominal cancellation fee to recoup a fraction of the cost. With this application, it will become possible to fill cancellations with minimal notice from the canceller cutting potential losses by a larger margin than late cancellation fees alone.

Advantages

Why would anyone choose our app? It is simple, easy-to-use for people with little-to-no technology experience, provides convenient instructional text messages to notify clients when they are eligible to fill in a cancellation, and it fits right on your mobile device! Written in java and developed on the android platform, these applications are the ideal and timely solution to cutting major cancellation costs.
